

AVA mobile application manual

1. Prior to working with the mobile application **AVA**, you must program the control panel **EBS**:

To connect the unit to the server EBS it requires the following parameters:

Server address: **ava01.ebstrade.com**

(please define a DNS server e.g. 8.8.8.8)

or **94.42.165.181**

Server port: **7458**

APN: appropriate for the SIM card (for public APN in the majority of providers: Internet)

Note: In the configuration of the control panel you have to activate the option "Users remote management enable" (Tab 7. Restrictions / Remote commands).

These parameters will automatically connect to the central server.

2. To download and run the application:

Please go to the appropriate store (Google Play, Apple AppStore) and when you type in a search engine AVA EBS then download an application called AVA.

After installing the application, you can register to the application server using the following parameters:

Address of the application server: **ava.ebstrade.com/ava**

S/N of the Control Panel

E-mail: entering this email address will empower you to recover the application's settings if you change your phone.

PIN: User Access Code that has been defined in the control panel

After approval of the above data, the application connects to the server and will allow the Smartphone to work with the panel.

The Smartphone must be set up to Internet mode or to be connected in a Wi-Fi network!
